

DevSecOps

Secure your pipeline
without slowing it down

Embed security into CI/CD pipelines - fast, effective, and focused on real risk reduction.

DevSecOps integrates security practices into the DevOps pipeline, ensuring that security is embedded throughout the software development lifecycle. Our solution emphasises the 'SEC' in DevSecOps by providing coaching, guided support, and implementing tools that genuinely reduce risk rather than just fulfilling compliance checkboxes.

Compliance and risk reporting

Supports IT governance, security, and audit readiness.

Strategic IT advisory services

Provides expert guidance aligned with business objectives and IT transformation goals.

Vulnerability and patch management

Enables monitoring and tracking of vulnerabilities with regular reporting.

Access and identity management

Ensures oversight of user access controls and regular privilege reviews.

The risks it uncovers

Missing security controls in CI/CD pipelines.

Insecure coding practices and unpatched vulnerabilities.

Secrets exposure and risky dependencies.

Weak access and identity controls.

Gaps in compliance and audit readiness.

Secure, agile delivery with DevSecOps built into every stage of your pipeline

Our approach

Gap analysis

Identify missing controls and align with NIST, OWASP, CIS.

Secure SDLC integration

Embed SAST, DAST, secrets detection, and more.

Support

Hands-on developer guidance and training.

Pipeline security implementation

Integrate security controls into the software delivery pipeline across all supported CI/CD platforms.

Governance support

Define realistic workflows for reviews and escalation.

Modern development environments demand speed and agility, making it essential to integrate security seamlessly into every stage of the delivery pipeline. DevSecOps ensures that security is not an afterthought, it's built-in from the start, enabling teams to deliver fast and securely.

Security is embedded across every phase, reducing risk exposure without compromising speed or delivery.

Strengthened audit readiness and governance through improved vulnerability tracking and access control oversight.

Developers gain the tools, training, and support needed to build secure applications confidently and efficiently.
